Executive Summary

This report provides an overview of the abortion facility landscape and services available to pregnant people seeking abortion, as offered by publicly advertising facilities across the United States (U.S.) from 2017 through 2023. This is the second in a series of ANSIRH's Trends Reports, in which we describe the abortion care landscape. An understanding of this landscape serves to inform policies and practices that impact people seeking abortion in the U.S.

The U.S. Supreme Court decision in *Dobbs v. Jackson Women's Health Organization* in June 2022, which overturned federal protections on the constitutional right to abortion once provided by *Roe v. Wade*, has had a substantial impact on the number and geographic distribution of abortion facilities nationwide. As of August 2024, 14 states ban abortion in almost all circumstances, and 4 other states have enacted 6-week bans,^{1,2} which has led to the closure of many abortion-providing facilities in those states. As a result, in many areas, a smaller number of abortion facilities are tasked with serving larger populations of people.

Meanwhile, across the country there has been a proliferation of virtual clinics that are medication abortion-only facilities that have no associated brick-and-mortar facility.³ Some of these facilities offer abortion care to residents of states with abortion bans or in states that prohibit the use of telehealth for abortion care. These providers operate under shield laws which reduce legal risks for the clinicians who provide this care.⁴

Our analysis identified 967 publicly-advertising facilities that were open and providing abortion services in 2023, up from 774 facilities in 2017. This growth was driven primarily by an increase in virtual clinics in 2022 and 2023 (Table 1). The number and distribution of abortion-providing facilities varied dramatically by geographic region and state. Nationally, there was approximately

one abortion facility per every 78,000 women of reproductive age in 2023, yet these estimates are marked by significant variation by geographic region, with each facility in the South representing more than three times the population size than each facility in the Northeast (Table 1).

While new facility openings largely kept pace with facility closures throughout our data collection period, the geographic distribution of these openings and closures was highly skewed (Table 2). Notably, the South was particularly affected by closures over time. New facility openings since the *Dobbs* decision have largely comprised of virtual clinics. In 2023, the majority (74%) of newly opened facilities were virtual clinics, though these openings predominantly occurred in states with laws that protect abortion access and where brick-and-mortar facilities are still prevalent.

Between 2017-2023, there was a major reduction in the number and proportion of facilities that provided procedural abortion, with 56% of U.S. facilities now providing medication abortion only (Table 3). Concurrently, there has been a downward trend in facility gestational limits for procedural abortion services (Table 4), the self-pay cost of abortion services has risen (Table 5), and insurance acceptance among facilities has declined (Table 6).

These findings demonstrate that abortion care looks dramatically different in states that have broad and legal access to abortion as compared to states that do not, and these differences have only become more pronounced in recent years. State policy changes have also impacted the types of abortion services facilities provide, how far in pregnancy services are offered, and cost and insurance coverage for those services. Such differences have resulted in major disparities in abortion access, which are shaped by policies that are not based in scientific evidence.

Section 1. Abortion-Providing Facilities

Key Takeaways:

The total number of abortion-providing facilities in the United States fluctuated over time but grew in 2022 and 2023. In 2023, we captured 967 facilities that were open and publicly providing abortion services, an increase from 774 facilities in 2017. The distribution of abortion-providing facilities varied dramatically by geographic region and state. While the state of California had 193 abortion-providing facilities in 2023, 13 states--all of which had abortion bans--had only one or two virtual clinics and no brick-and-mortar facilities.

We tracked the number of publicly advertising facilities that provided abortion services across the U.S. between 2017-2023, including both brick-and-mortar and virtual clinics.

- The number of abortion-providing facilities has grown in all regions of the U.S. since 2017, from 774 to 967 in 2023 (Figure 1, Table 1).
- The increase in total number of open facilities in 2023 was largely driven by the expansive growth of virtual clinics. Newly opened virtual clinics outnumbered newly opened brick-and-mortar facilities significantly in all regions of the U.S. (Figure 4).
 - » While virtual clinics offer an opportunity to expand the geographic reach of abortion care, their abortion services are limited to medication abortion only, which limits their utility for those who may prefer procedural services and/or require later abortion care.
- In 2023, the West continued to have the highest number of abortion-providing facilities (372), followed by the Northeast (266), while the South (186) and Midwest (143) had the fewest.
 - » There was a net decrease in abortion facilities in the U.S. South in 2022 after the *Dobbs* decision, and state abortion bans have led to numerous facility closures throughout the region.
 - » This drop was followed by an increase in facilities in all regions in 2023 due to the rapid expansion of virtual clinics.

Figure 1. Number of Abortion-Providing Facilities, by Geographic Region and Year (2017-2023)

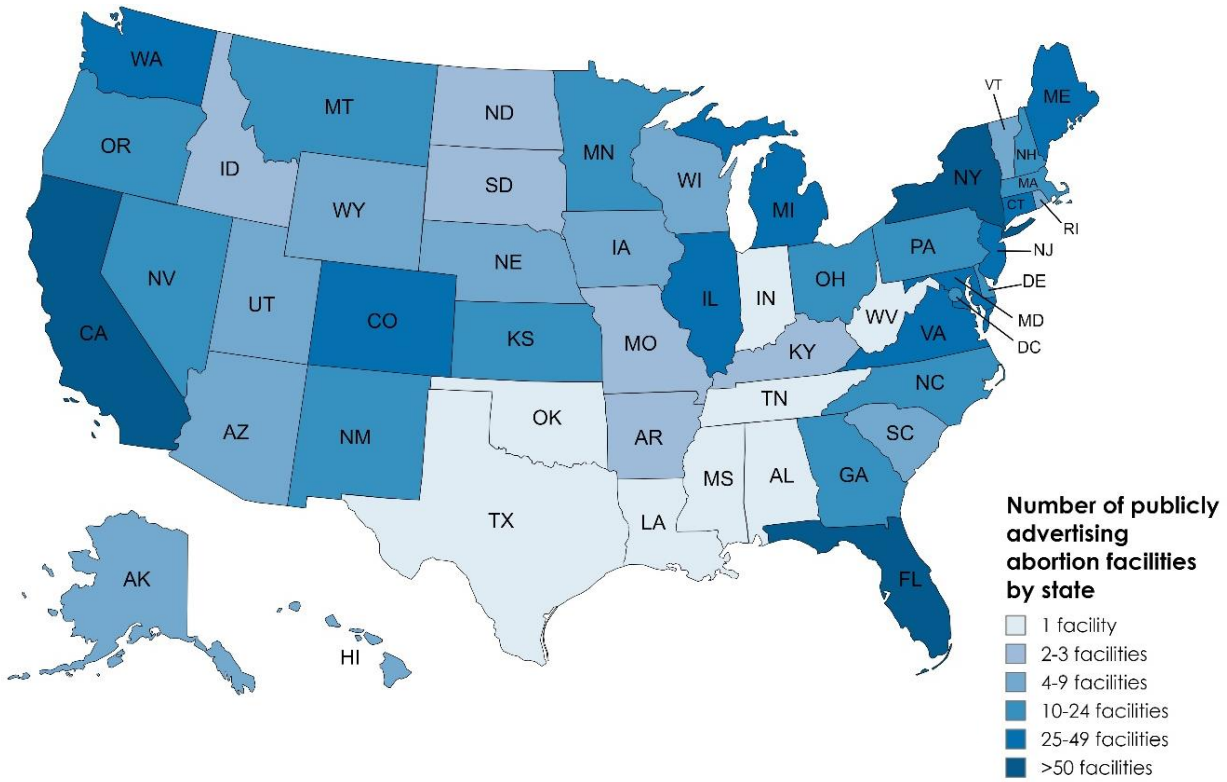

Note: This graph shows the net change in facility openings and closings, per region. Counts include virtual clinics, which are counted once per each individual state they serve.

Section 2. Newly Opened and Newly Closed Facilities

Key Takeaways:

Abortion facility closures and openings generally kept pace with each other nationally between 2017-2022, but we captured a significant increase in the overall number of facilities in 2023. This increase was largely due to the introduction of new virtual telehealth facilities in 2022 and 2023, which led to a net increase of facilities that outpaced previous years. Throughout all years, there was major geographical variation in where openings and closures occurred over time. There were more newly opened facilities than closures in the West, Midwest, and Northeast, while the South experienced a net loss of facilities between 2017 and 2023.

We tracked the number of facilities that closed or stopped providing abortion between data collection years as well as the number of new facilities that opened or started providing abortion between years.

- In 2017, the U.S. saw many more closures (n=29) than openings (n=5), but by 2023, the opposite was true. The U.S. saw 50 closures but 221 new facility openings (Figure 3, Table 2).
 - » Major geographical differences were seen in closures following the *Dobbs* decision in 2022, particularly in the South.
- New facility openings in 2023 were distributed across the U.S., though the West experienced more openings than any other region (n=84, 38% of all new facilities), followed by the Northeast (n=51, 23%), and 43 (19%) in both the South and Midwest.
- Among the 221 newly opened abortion facilities in the U.S. in 2023, three-fourths (n=166) were virtual clinics.
 - » Brick-and-mortar facilities accounted for only 1 in 5 new facilities in the Northeast and Midwest regions, 1 in 4 facilities in the South, and 1 in 3 facilities in the West.

Figure 3. Number of Abortion-Providing Facilities that Closed or Newly Opened, by Geographic Region and Year (2017-2023)

Note: This graph displays the number of new facility openings and facility closures between years. To be included as a “new” facility in any given year, the facility must have never been open in a previous data collection year.

Figure 4. Number of Newly Opened Facilities, by Facility Type (2023)

Source: ANSIRH's Abortion Facility Database, 2017-2023

Section 3. Women of Reproductive Age per Abortion-providing Facility

Key Takeaways:

In 2023, there was approximately one abortion-providing facility per every 78,000 reproductive-aged women in the U.S. However, this estimate largely masks major geographic differences in the number of and distribution of abortion facilities in each region, which has a significant impact on the patient volume at each of these facilities. In the Northeast, there was one abortion facility for every 48,000 women of reproductive age in 2023, while in the South, there was one facility for every 158,000 women of reproductive age, many of which were virtual only clinics. Thus, facilities in the South were serving populations more than three times larger than those in the Northeast.

To provide an indicator of abortion access, we calculated the number of women of reproductive age** per abortion-providing facility in each geographic region and state using U.S. Census population estimates.⁵ These estimates provide an indicator of access for people in a geographic region or state who may become pregnant and thus may have a potential need for abortion services in the future.

- The estimated number of women of reproductive age (WRA) per abortion-providing facility declined over time due to an increase in the total number of facilities across the U.S., from one facility per 96,000 WRA in 2017 to one facility per 78,000 WRA in 2023 (Figure 5, Table 1).
- Regional differences persisted in 2023, with one facility per 48,000 WRA in the Northwest, one facility per 49,000 WRA in the West, one facility per 106,000 WRA in the Midwest, and one facility per 158,000 WRA in the South.
- Between 2017 and 2023, the number of WRA per abortion-providing facility declined in all U.S. regions other than the South.
 - » In 2022, the South saw a sharp increase in the number of WRA per facility due to the closure of many of the region's abortion facilities and then returned to 2021 estimates in 2023.
- These downward trends in WRA per facility are largely due to the high number of new virtual clinics that began to open in 2022 and 2023.

** The U.S. Census data available for this estimate uses "women of reproductive age," defined as people who were assigned female at birth and aged 15 to 49 at the time of data collection. We have employed the term "women" in this section as a proxy for the population of all genders who can and do become pregnant.

Figure 5. Women* of Reproductive Age per Abortion-Providing Facility, by Geographic Region and Year (2017-2023)

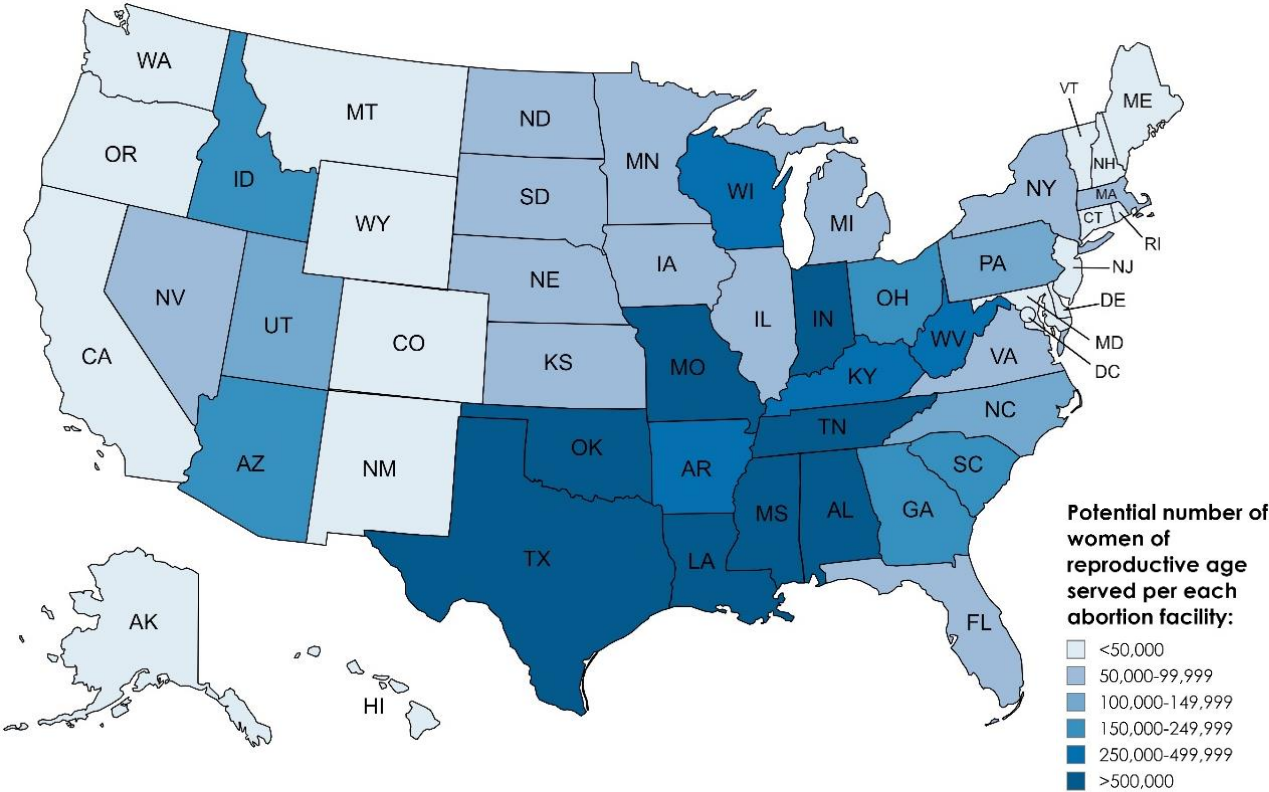

Note: These figures were estimated by dividing the total population of women of reproductive age (aged 15-49) from regional U.S. Census data by the total number of facilities in each region.

Source: ANSIRH's Abortion Facility Database, 2017-2023

*While people of all genders have abortions, this chart uses the term "women" because it reflects U.S. Census data which categorizes those assigned female at birth under the term "women."

Figure 6. Estimated Number of Women of Reproductive Age per Each Publicly-Advertising Abortion Facility, by State (2023)

Source: ANSIRH's Abortion Facility Database, 2017-2023

Section 4. Abortion Services Offered

Key Takeaways:

Between 2017-2023, the number and proportion of abortion facilities in the U.S. that offered only medication abortion services increased significantly. Much of this change can be attributed to the opening of many new medication abortion-only virtual clinics throughout the U.S. Virtual clinics often offer a less costly, more timely, and more convenient opportunity to access abortion care, particularly for those living in states where abortion is banned or where access is severely restricted. At the same time, the reduction in the number and proportion of facilities providing procedural abortion services further limits abortion access for pregnant people seeking abortion services later in pregnancy or those who would prefer a procedural abortion over a medication abortion.

Abortion facilities may offer different services depending on their locale, existing state laws governing abortion provision, the needs of their patient population, or the training of their healthcare providers, among other considerations. While most facilities provided both medication and procedural abortion services to patients, others provided only medication abortion services, and a minority of facilities offered procedural abortion only.

- The trend toward an increasing proportion of medication abortion-only facilities throughout the U.S. continued in both 2022 and 2023 (Figure 7, Table 3).
 - » While a slight increase was seen in 2022, the steep rise of virtual clinics providing medication abortion-only services following *Dobbs*, including providers working under shield laws to mail medication abortion pills to states where abortion is otherwise banned,⁴ has led to more than half (56%) of all facilities in the U.S. providing only medication abortion services as of 2023.
- Among new facilities opened in 2023, 85% were medication abortion-only, the majority of which were virtual clinics.
- By 2023, only 2 facilities in the U.S. provided procedural abortion only, down from 4% of all facilities (n=34) in 2017.
- Approximately 6 in 10 facilities in the West (60%), Northeast (61%), and Midwest (56%) are medication abortion-only facilities, while 39% of facilities in the South are now medication abortion-only.

Figure 7. Percentage of Facilities Providing Each Type of Abortion Services, by Geographic Region and Year (2017-2023)

Source: ANSIRH's Abortion Facility Database, 2017-2023

Section 5. Facility Gestational Limits

Key Takeaways:

In 2023, the median gestational limit among U.S. abortion facilities was 11 weeks for medication abortion and 16 weeks for procedural abortion. However, there was substantial variability in the median gestational limits for procedural abortion among individual facilities, even when accounting for state gestational limits. Facility gestational limits for procedural abortion services ranged from 6 weeks to 34 weeks and 6 days, while medication abortion gestational limits exhibited much less variability.

While abortion-related gestational limits are primarily determined by state law, an individual facility may further reduce its own gestational limit based on provider training, provider comfort, clinic scheduling, anesthesia availability, and availability of equipment.⁷ Thus, facility gestational limits may often fall below a state's mandated gestational limit. For medication abortion, the U.S. Food and Drug Administration (FDA) has approved medication abortion for use up to 10 weeks, but clinicians are able to legally prescribe mifepristone beyond that limit based on clinical evidence of its effectiveness at later gestations. Currently, evidence supports its use up to 12 weeks of pregnancy.^{8,9}

- The median gestational limit for medication abortion throughout the U.S. remained stable at 10 weeks from 2017-2022 but increased to 11 weeks across all regions in 2023.
 - » Geographic variability was seen in this measure, as medication abortion gestational limits ranged between 6 to 14 weeks gestation depending on state and individual facility limits (Figure 8, Table 4).
- The median gestational limit for procedural abortion for U.S. facilities decreased from 18 weeks of pregnancy in 2017 to 16 weeks in 2023.
 - » Median gestational limits for procedural abortion varied by U.S. geographic region, ranging from 15 weeks in the South to 19 weeks and 6 days in the Midwest.
 - » Depending on state and individual facility, gestational limits for procedural abortion ranged from 6 weeks to 34 weeks and 6 days gestation.

Section 6. Median Self-Pay Costs for Abortion Services

Key Takeaways:

In 2023, the median self-pay cost for abortion services in the U.S. was \$563 for medication abortion, \$650 for first-trimester procedural abortion, and \$1,000 for second-trimester abortion services. Median national costs for medication abortion, first-trimester procedural abortion, and second-trimester procedural abortion all increased between 2017-2023. There was major regional variation in the cost of all abortion services, and all regions experienced increased costs over time, though abortion services were most expensive in the West across all years. Given that the majority of abortion patients are low income, current prices across the U.S. may put abortion out of reach for many in need of these health services.

Most abortion patients self-pay for their abortion and thus it is important to understand the prices set by clinics. The self-pay price set by abortion-providing facilities is influenced by many factors, including the ability to rely on advanced practice clinicians for provision of care; costs of workforce salaries, rent, equipment, and liability insurance; amount of security measures required; and mandated construction resulting from state restrictions. These costs also vary based on abortion type and geographic location.^{11,12}

- From 2017 to 2023, the median self-pay cost for all abortion services increased. Medication abortion increased from \$495 in 2017 to \$563 in 2023, first-trimester procedural abortion increased from \$475 in 2017 to \$650 in 2023, and second-trimester abortion services increased from \$935 in 2017 to \$1,000 in 2023 (Figure 9, Table 5).
- For all three abortion types, median costs varied by region in all years.
 - » In 2023, medication abortion was least expensive in the Midwest (\$475) and most expensive in the West (\$612).
 - » In 2023, procedural abortion services were least expensive in the South (\$575 for first-trimester services and \$810 for second-trimester services) and most expensive in the West (\$785 for first-trimester services and \$1,300 for second-trimester services).
- In 2023, depending on state and facility, median medication abortion services ranged from \$150-\$800, median first-trimester procedural abortion services ranged from \$495-\$1,150, and median second-trimester abortion services ranged from \$440-\$3,025.
- Across all years, there was much greater variability in costs for second-trimester abortion services than for medication abortion or first-trimester procedural abortion services, as the costs of second-trimester abortion may vary greatly depending on the precise week of pregnancy.

Median Cost of Second-Trimester Abortion Services*

*Note: We did not collect cost data on second-trimester abortions in 2019.

Source: ANSIRH's Abortion Facility Database, 2017-2023

Section 7. Insurance Acceptance

Key Takeaways:

Insurance coverage for abortion services varied widely by state and geographic region but has been declining in all regions between 2017-2023. The inclusion of new medication abortion-only virtual telehealth facilities in 2021-2023, which often do not accept insurance, further reduced the proportion of facilities that accepted a form of insurance. In 2023, 7 in 10 facilities in both the Northeast and West accepted a form of insurance, 6 in 10 Midwest facilities accepted insurance, while slightly over half of facilities in the South accepted a form of insurance. In addition to an increase of virtual telehealth facilities, the reduction in insurance acceptance over time is likely due to low reimbursement rates that facilities receive for abortion services provided.¹³

- The majority of U.S. facilities accept at least one form of insurance for abortion services, but that percentage decreased from 82% in 2017 to 66% in 2023 (Figure 10, Table 6).
- Insurance coverage varies by geographic region. A majority of facilities in the Northeast (74%), West (71%), and Midwest (59%) accept insurance, while just over half (52%) of facilities in the South accepted any insurance as of 2023.
- Only 10% of virtual clinics accepted any form of insurance as of 2023.

Figure 10. Percentage of Facilities that Accept Any Form of Insurance, by Geographic Region and Year (2017-2023)

Source: ANSIRH's Abortion Facility Database, 2017-2023

Section 8. Planned Parenthood and Independent Facilities

Key Takeaways:

From 2017-2021, approximately half of abortion facilities in the U.S. were run independently, and half were Planned Parenthood affiliates. However, in 2023, the share of independent facilities increased to approximately two-thirds of all facilities, largely due to the rise in new virtual clinics. There is regional variation in this, as most facilities in the South were independent and most facilities in the West were Planned Parenthood affiliates.

In the U.S., abortion-providing facilities can be categorized as either independently run or as Planned Parenthood affiliates. While Planned Parenthood is a national nonprofit organization, independently run facilities can be either nonprofit or privately owned.

- As of 2023, approximately two-thirds of all abortion-providing facilities were independently run (64%), and 36% were Planned Parenthood affiliates ([Figure 11](#), [Table 7](#)).
 - » While relative proportions remained relatively stable between 2017-2021, the rapid growth of virtual clinics in 2022 and 2023 has resulted in a higher proportion of independent facilities.
- Independent facilities constituted the majority of all facilities in all regions: the South (78%), the Midwest (66%), the Northeast (63%), and the West (56%).
 - » The greatest change occurred in the West, where the proportion of facilities run by Planned Parenthood decreased from 60% to 44% from 2017-2023.

--indicates no facilities were open and providing abortion services

Note 1: This table shows the net change in facility openings and closings.

Note 2: Potential patients served was estimated by dividing the population of women of reproductive age (ages 15-49) from U.S. Census data by the total number of facilities in each region. We used data on "women" as a proxy for people who can become pregnant. This calculation was done for the U.S. at large, each region and subregion, and each state.

Note 3: 2019, 2020, and 2021 denominators were derived from 2019 Census data. 2022 and 2023 estimates were derived from 2022 Census data.

Table 2. Total number of abortion facility closures and the net change in open abortion facilities, by geographic region and state from 2017- 2023.

*Note: To be included as a “new” facility in any given year, the facility must have never been open in a previous data collection year. (For example, if a clinic was open in 2020 but not in 2017, 2018, or 2019, it would be considered a new clinic in 2020. However, if a clinic was open in 2017 and 2018 but temporarily closed in 2019, it would not be considered a “new” clinic if reopened in 2020.)

Table 3. Types of abortion services offered by abortion facilities, by geographic region and state from 2017-2023.

Geographic region and state	Facilities offering only procedural abortion only, n (%)							Facilities offering only medication abortion only, n (%)							Facilities offering both procedural abortion and medication abortion, n (%)

*Gestational limit defined as number of weeks since last menstrual period (LMP). Where gestational limits specify both the number of weeks and days to which abortion services are legal and/or available, estimates have been rounded up to the nearest whole number. For example, a state's median gestational limit of 19 weeks and 6 days has been rounded to 20 weeks in this table.

--indicates no facilities were open and providing abortion services

⌘ Note: 2022 and 2023 data for state and subregion is embargoed pending publication in a peer-reviewed journal.

Table 5. Median abortion self-pay charges in the U.S. (in USD\$), by type of abortion, 2017-2023.

Geographic region and state	Median cost of medication abortion services							Median cost of first trimester procedural abortion services							Median cost of second trimester procedural abortion services

* indicates missing data

--indicates no facilities were open and providing abortion services

indicates no facilities were providing these procedural abortion services

Note: We did not collect charge data on second-trimester abortions for 2019. Additionally, for the years of 2017 and 2018, we primarily utilized charges that were published on facility websites, leading to fewer than half of facilities to be represented for those years.

Table 6. Number and percentage of facilities accepting any type of insurance, by geographic region and state in 2017-2023.

--indicates no facilities were open and providing abortion services

Methodology

Data Collection

We used data from Advancing New Standards in Reproductive Health (ANSIRH)'s Abortion Facility Database, which includes data on publicly-advertising abortion facilities and was systematically updated every summer during June through September of the years 2017, 2018, 2019, 2020, 2021, 2022, and 2023.

In this analysis, we included all facilities that publicly advertised that they provide abortion services within all 50 U.S. states and Washington, DC. The database includes a wide range of facilities including doctor's offices, public health centers, and hospital settings. Updates followed a structured process, including initial online searches to identify abortion facilities throughout the U.S. and mystery shopper calls to confirm and obtain additional information from the facilities from the perspective of a potential patient. Each year we checked data for all facilities in the database against the prior year, identified any changes—including closures—and added any facilities that had newly begun to offer abortion care.

We limited our online search to the search engine Google and used the Chrome browser's incognito mode to search for facilities by state and city, using the keywords "abortion clinic in [state]" and "abortion clinic in [city]" for all cities with a population of 100,000 or larger in each state and for the three largest cities for states that did not have a city of that size. We examined links to facilities from the first three pages of results for states and first two pages for cities. After each search, we cleared the browsing history, including cookies and other site data. When possible, we cross-checked the list using additional abortion provider directories including [ineedana.com](https://www.ineedana.com) and www.abortionfinder.org, as well as abortion facility organizational membership lists.

After updating the list of facilities through web searches and documenting any data found online, we conducted mystery shopper telephone calls to each facility to supplement any missing data. Mystery callers asked general questions about the facilities' services, but when a facility staff member inquired about their personal details, callers replied that they were 20 years old and living in the same city as the facility and gave a last menstrual period date that would place them in the first trimester. Mystery callers did not make appointments.

Through these searches and calls, we documented data on each abortion facility, including address with state and zip code; types of abortions offered; self-pay costs for medication abortion, first-trimester procedural abortion, and second-trimester abortion; and whether the facility accepted any type of insurance for abortion care. All facilities were categorized by state and by region, using U.S. Census categories.⁵ More information about data collection methods can be found elsewhere.^{11,12,14}

In 2023, we added telehealth services operating within the U.S. healthcare system regardless of whether they provided care into states that legally permit telehealth for abortion. Aid Access and Abuzz, which began to provide care under shield laws into states with abortion bans or restrictions on telehealth abortion in 2023, were included as of that year.⁴ All telehealth services were counted in the states they mailed medications to, and not the states where they prescribed from.

Virtual clinics that serve multiple states were counted as separate facilities, once for each state in which it serves. Thus, if a virtual clinic operated in 20 states, it was counted as 20 separate facilities. In this way, we were able to capture prices or insurance policies that may have differed

by state, even when offered by the same virtual clinic. Most data for virtual clinics could not be verified by a mystery shopper call, so we relied on information listed on their websites.

Brick-and-mortar facilities in the same state that were part of the same affiliate or facility group were counted as a single telehealth provider because they advertised their telehealth services jointly, including a common website or phone number, and common pricing. We refer to these as “facility groups.” When facility groups spanned more than one state, they were counted separately by state.

A final note about cost data: In 2017 and 2018, data collection on self-pay charges primarily reflected prices listed on facility websites. In 2019-2021, we relied more heavily on mystery shopper calls to collect first-trimester abortion prices when prices were not listed on websites. In all years, prices for second-trimester abortions were almost exclusively obtained from facilities’ websites and not through mystery shopper calls, contributing to greater levels of missing data because many websites did not contain prices. In addition, websites often offered ranges in prices, particularly for second-trimester abortions. In 2019 we did not record data on second- trimester costs at all. In some cases, particularly large hospitals, facilities were unable to give a self- pay price, leading to missing data.

Analysis

To describe the abortion landscape in the U.S., we present annual information including the open status of publicly available abortion facilities, estimated number of women of reproductive age per facility, the types of abortion services offered, cost of abortion services, insurance acceptance, and whether the facility was independently run or a Planned Parenthood affiliate. We considered an abortion facility to be “open” if they were open and providing at least one type of abortion service at the time of the mystery call.

We collected data on the types of services provided by each facility (e.g. medication and/or procedural abortion). Insurance acceptance data were categorized as a binary yes/no value based on whether a facility accepted any type of insurance, and a facility was classified as a Planned Parenthood affiliate if it included “Planned Parenthood” in the facility name.

We utilized U.S. Census data⁵ to estimate the population of women (defined as those assigned female at birth) of reproductive age [aged 15-49 years old] per facility in 2017-2023 and utilized Census definitions to determine geographic regions and subregions.¹⁵ This estimate serves as a measure of the potential patient burden each facility could experience under the assumptions that patients sought care in their state of residence and that the demand for abortion was equally distributed across all facilities within each state.

We used descriptive statistics to analyze each of our measures of interest by year, by state, and by geographic region and subregion to examine trends in abortion access. We excluded missing data from the analysis.

Definitions

Brick-and-mortar facility: A facility that provides abortion services “in-person” at a physical location or medical office.

Shield law: Legal protections for clinicians who offer medication abortions via telehealth to people living in states that ban abortion or have restrictions on telehealth abortion.

Telehealth services: Medication abortions offered by a clinician through a remote consultation with the patient (via video, phone, or messaging) that results in medications dispensed via mail.

Virtual clinic: A facility that offers abortion services via telehealth and which has no associated brick-and-mortar facility located within the same state.

Acknowledgments

The authors thank the summer interns who helped update the ANSIRH Abortion Facility Database over the years: Alejandra Vargas Johnson, Lauren Sobel, Mihiri Karunaratne, Mahima Krishnamoorthi, Yuki Davis, Atreyi Mitra, Salma Tayel, Subeksha Sharma, Talia Kieu, Ari Villanueva, Jaaie Varshney, Angie Shin, Olivia Burke, Devanshi Tomar, Joy Elensi, Eleanor Carey, Conner Spinks, and Chancey Herbolsheimer. The authors also appreciate efforts from Chris Ahlback and Isabel Muñoz for database management.
